Installing the appliance

T-79

- ① adapter cabinet
- ② appliance
- ③ kitchen cabinet
- ④ wall

The appliance can be installed in any fitted kitchen. To match the appliance to the height of the fitted kitchen, a suitable adapter cabinet ① can be installed over the appliance.

A ventilation gap of at least 2 inches (50 mm) must be provided between the adapter cabinet and the kitchen wall. The ventilation cross-section below the room ceiling must be at least 46 in² (300 cm²) so that warm air can escape without obstruction. Otherwise the appliance has to work harder, which results in increased energy consumption.

The ventilation cross-sections must not be blocked or covered in any way. They also need to be dusted/cleaned on a regular basis.

If installing with standard kitchen cabinets (max. depth 580 mm), the appliance can be set up directly next to the kitchen cabinet. In that case the side of the appliance door would project 34 mm and the middle of the appliance 55 mm beyond the front of the kitchen cabinet. This allows the appliance door to open and close properly.

If the appliance is installed **next to a wall** ④, a gap of at least 55 mm is needed on the hinge side between the wall ④ and the appliance ②. This allows space for the handle when the door is open.

Installing the oven

⚠ The oven must not be operated until it has been properly installed within cabinetry.

The oven must have an adequate supply of cool air for proper operation. The required air must not be heated excessively by other heat sources, e.g. wood burning stove.

Observe the following when installing:

Build into cabinetry with no back wall.

Make sure that the shelf that the appliance sits on does not touch the wall.

Do not install insulation strips on the side walls of the cabinet housing.

Before installation

- Before connecting the oven to the power supply, first disconnect the power supply from the oven isolator switch.

Installing the oven

- Connect the power cord to the electrical supply.

Do not carry the oven by the door handle. The door can be damaged. Use the handles on each side of the oven to carry it.

It is recommended that you remove the door before installing the appliance (see "Cleaning and Care - Removing the door") and all oven accessories from the cavity. This will make for easier installation into the niche and will not tempt you to use the handle to carry it.

- If there are side handles, please remove them.
- Push the oven into the cabinetry and align it.
- Open the door (if it was not removed previously).

- Use the supplied screws to secure the oven to the side walls of the cabinetry through the holes in the trim.
- Reinstall the door, if necessary (see "Cleaning and care - Installing the door").

Before connecting the appliance to the power supply, make sure that the voltage and frequency listed on the data plate correspond with the household electrical supply. This data must correspond to prevent machine damage. Consult an electrician if in doubt.

Only operate the appliance after it has been installed into cabinetry.

The plug must be plugged into an appropriate outlet that is installed and grounded in accordance with all local codes and ordinances.

Safety distance from the wall covering

T-79

If a wall covering is installed, a minimum safety distance must be maintained between the countertop cut-out and the covering, since high temperatures can damage these materials.

If the covering is made of a combustible material (such as wood), the distance between the countertop cut-out and the wall covering must be a minimum of 2" (50 mm).

For coverings made of non-combustible materials (such as metal, marble, granite or ceramic tiles) the minimum safety distance ⑤ between the countertop cut-out and the wall covering must be 2" (50 mm) minus the thickness of the covering.

For example: thickness of wall covering 9/16" (15 mm)

2" (50 mm) - 9/16" (15 mm) = minimum safety distance 1 3/8" (35 mm).
